

5476/DM5476/DM7476 Dual Master-Slave J-K Flip-Flops with Clear, Preset, and Complementary Outputs

General Description

This device contains two independent positive pulse triggered J-K flip-flops with complementary outputs. The J and K data is processed by the flip-flop after a complete clock pulse. While the clock is low the slave is isolated from the master. On the positive transition of the clock, the data from the J and K inputs is transferred to the master. While the clock is high the J and K inputs are disabled. On the negative transition of the clock, the data from the master is trans-

ferred to the slave. The logic state of J and K inputs must not be allowed to change while the clock is high. The data is transfered to the outputs on the falling edge of the clock pulse. A low logic level on the preset or clear inputs will set or reset the outputs regardless of the logic levels of the other inputs.

Features

Alternate Military/Aerospace device (5476) is available. Contact a National Semiconductor Sales Office/Distributor for specifications.

Function Table

Inputs					Outputs		
PR	CLR	CLK	J	K	Q	Q	
L	Н	Х	Х	Х	Н	L	
∮ н	L	Х	X	×	L	Н	
L	L	Х	X	×	H*	H*	
H	Н	1	L	L	Q_0	\overline{Q}_0	
H	Н	л.	Н	L	Н	L	
Н	H	_T_	L	Н	L	Н	
H	Н	7.	Н	Н	Toggle		

H = High Logic Level

L = Low Logic Level

X = Either Low or High Logic Level

¬□ = Positive pulse data. The J and K inputs must be held constant while
the clock is high. Data is transfered to the outputs on the falling edge of the
clock pulse.

* = This configuration is nonstable; that is, it will not persist when the preset and/or clear inputs return to their inactive (high) level.

 Q_0 = The output logic level before the indicated input conditions were established

Toggle = Each output changes to the complement of its previous level on each complete active high level clock pulse.

Absolute Maximum Ratings (Note)

If Military/Aerospace specified devices are required, please contact the National Semiconductor Sales Office/Distributors for availability and specifications.

Supply Voltage 7V Input Voltage 5.5V

Operating Free Air Temperature Range

Storage Temperature Range -65°C to +150°C

Note: The "Absolute Maximum Ratings" are those values beyond which the safety of the device cannot be guaranteed. The device should not be operated at these limits. The parametric values defined in the "Electrical Characteristics" table are not guaranteed at the absolute maximum ratings. The "Recommended Operating Conditions" table will define the conditions for actual device operation.

Note 1: The symbol (↑, ↓) indicates the edge of the clock pulse is used for reference (↑) for rising edge, (↓) for falling edge.

Note 2: All typicals are at $V_{CC} = 5V$, $T_A = 25$ °C.

Note 3: Not more than one output should be shorted at a time.

Note 4: With all outputs open, I_{CC} is measured with the Q and Q outputs high in turn. At the time of measurement the clock input is grounded.

Note 5: Clear is measured with preset high and preset is measured with clear high.

Note 6: $T_A = 25^{\circ}C$ and $V_{CC} = 5V$.

$\textbf{Switching Characteristics} \text{ at V}_{CC} = 5 \text{V and T}_{A} = 25^{\circ}\text{C (See Section 1 for Test Waveforms and Output Load)}$
