## DS8921/DS8921A/DS8921AT Differential Line Driver and Receiver Pair

## General Description

The DS8921, DS8921A are Differential Line Driver and Receiver pairs designed specifically for applications meeting the ST506, ST412 and ESDI Disk Drive Standards. In addition, these devices meet the requirements of the EIA Standard RS-422.
The DS8921, DS8921A receivers offer an input sensitivity of 200 mV over a $\pm 7 \mathrm{~V}$ common mode operating range. Hysteresis is incorporated (typically 70 mV ) to improve noise margin for slowly changing input waveforms.
The DS8921, DS8921A drivers are designed to provide unipolar differential drive to twisted pair or parallel wire transmission lines. Complementary outputs are logically ANDed and provide an output skew of 0.5 ns (typ.) with propagation delays of 12 ns .
The DS8921, DS8921A are designed to be compatible with TTL and CMOS.

## Features

- 12 ns typical propagation delay
- Output skew - 0.5 ns typical
- Meet the requirements of EIA Standard RS-422
- Complementary Driver Outputs
- High differential or common-mode input voltage ranges of $\pm 7 \mathrm{~V}$
- $\pm 0.2 \mathrm{~V}$ receiver sensitivity over the input voltage range
- Receiver input hysteresis-70 mV typical
- DS8921AT industrial temperature operation $\left(-40^{\circ} \mathrm{C}\right.$ to $\left.+85^{\circ} \mathrm{C}\right)$

## Connection Diagram

TL/F/8512-1
Order Number DS8921M, DS8921N, DS8921AM, DS8921AN, DS8921ATM, DS8921ATN or DS8921ATJ
See NS Package Number J08A, M08A or N08E

## Truth Table

Note 1: "Absolute Maximum Ratings" are those values beyond which the safety of the device cannot be guaranteed. They are not meant to imply that the device should be operated at these limits. The Table of "Electrical Characteristics" provides conditions for actual device operation.
Note 2: All currents into device pins are shown as positive values; all currents out of the device are shown as negative; all voltages are referenced to ground unless otherwise specified. All values shown as max or min are classified on absolute value basis.
Note 3: All typical values are $\mathrm{V}_{\mathrm{CC}}=5 \mathrm{~V}, \mathrm{~T}_{\mathrm{A}}=25^{\circ} \mathrm{C}$.
Note 4: Only one output at a time should be shorted.
Note 5: Difference between complementary outputs at the $50 \%$ point.
Note 6: Differential Delays are defined as calculated results from single ended rise and fall time measurements. This approach in establishing AC performance specifications has been taken due to limitations of available Automatic Test Equipment (ATE).
The calculated ATE results assume a linear transition between measurement points and are a result of the following equations:
$T_{c r}=\frac{\left(T_{\mathrm{fb}} \times T_{\mathrm{rb}}\right)-\left(T_{\mathrm{ra}} \times T_{\mathrm{fa}}\right)}{T_{\mathrm{rb}}-T_{\mathrm{ra}}-T_{\mathrm{fa}}+T_{\mathrm{fb}}}$
Where: $T_{c r}=$ Crossing Point
$T_{\text {ra }}, T_{\text {rb }}, T_{\mathrm{fa}}$ and $T_{\text {tb }}$ are time measurements with respect to the input. See Figure 6.
