

## 5 BIT – D/A CONVERTER AND POSITION AMPLIFIER

- 5 BIT D/A CONVERTER (1/2 LSB MAX LINEARITY ERROR) ;
- ERROR AMPLIFIER ;
- POSITION AMPLIFIER.

### DESCRIPTION

The L291, a monolithic LSI circuit in a 16-lead dual in-line plastic package, is intended for use with the L290 and L292 to form a complete 3 chip DC motor positioning system for applications such as carriage/daisy-wheel position control in typewriters.

The L290/291/292 system can be directly controlled by a microprocessor.

## D/A CONVERTER

The L291 contains a 5-bit D/A converter accepting a binary code and generating a bipolar output current, the polarity of which depends on the SIGN input. The amplitude of the output current is a multiple of a reference current  $I_{ref}$ .

The maximum output current is

$$I_{FS} = \pm \frac{31}{16} I_{ref}$$

The following table shows the value of  $I_o$  for different input codes. Note that the input bits are active low.

DIGITAL INPUT WORD						Output Current $I_o$
SIGN	SC5 MSB	SC4	SC3	SC2	SC1 LSB	
L	L	L	L	L	L	$-\frac{31}{16} I_{ref}$
L	H	H	H	H	L	$-\frac{1}{16} I_{ref}$
X	H	H	H	H	H	0
H	H	H	H	H	L	$+\frac{1}{16} I_{ref}$
H	L	L	L	L	L	$+\frac{31}{16} I_{ref}$

X = indifferent

L = low

H = high

This D/A converter has a maximum linearity error equal to  $\pm 1/2$  LSB (or  $\pm 1.61\%$  Full Scale) ; that guarantees its monotonicity.

## ERROR AMPLIFIER

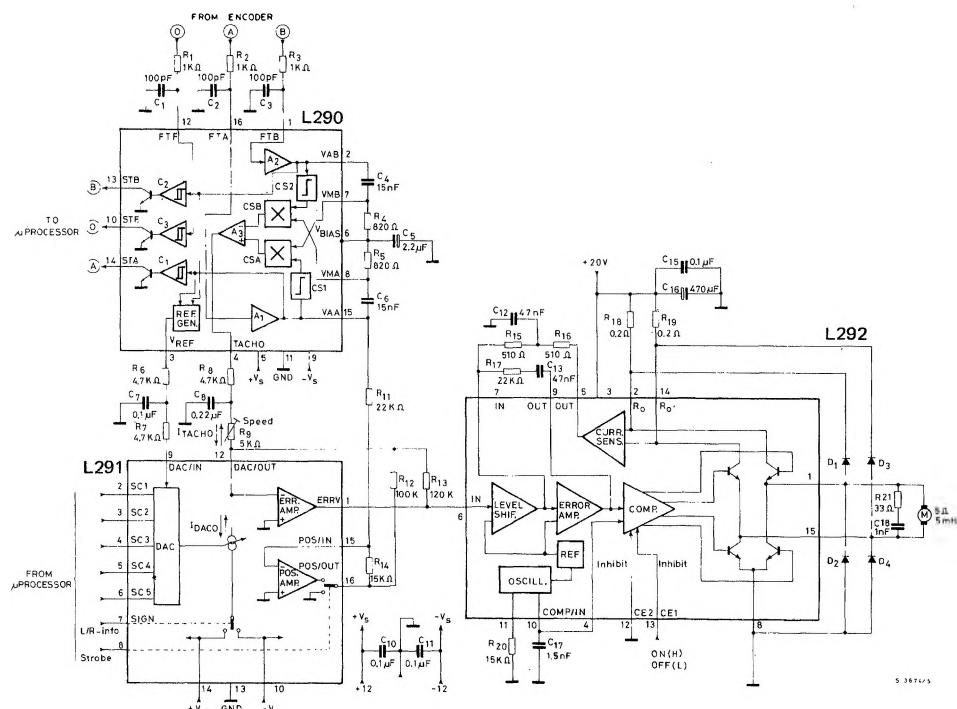

In order to have a good stability, the Error Amplifier must work with a closed loop gain greater or equal than 20 dB.

## POSITION AMPLIFIER

It is inserted by means of the strobe signal, TTL and microprocessor compatible. Its output is connected to pin 16 when  $V_{strobe} = \text{Low}$  ; pin 16 is grounded for  $V_{strobe} = \text{High}$ .
