

QUAD TRANSISTOR SWITCH

- OUTPUT VOLTAGE TO 50 V
- OUTPUT CURRENT TO 1.2 A
- VERY LOW SATURATION VOLTAGE
- TTL COMPATIBLE INPUTS
- INTEGRAL SUPPRESSION DIODE

The emitters of the four switches are commoned. Any number of inputs and outputs of the same device may be paralleled.

This device is intended to drive coils such as relays, solenoids, unipolar stepper motors, LED, etc.

DESCRIPTION

The L6222 monolithic quad transistor switch is designed for high current, high voltage switching applications.

Each of the four switches is controlled by a logic input and all four are controlled by a common enable input. All inputs are TTL-compatible for direct connection to logic circuits. Each switch consists of an open-collector transistor plus a clamp diode for applications with inductive loads.
