The LB1810M is a 3-phase DD motor driver IC and is an ideal FDD spindle motor driver for 3.5 inch applications.

**Functions and Features**

- Three phase total wave linear driver.
- Eliminates need for output electrolytic capacitor (however, depending on the motor, this may not apply)
- On-chip digital speed control :  $f_{OSC}=(1024 \times f_{FG})/D$   
When SL1=high D=5/8,  
SL1=low D=6/8
- Start/Stop circuit. S/S1 : high active, S/S2 : low active.
- Rotation speed switching.
- Current limiter circuit.
- On-chip index comparator (single HYS).
- On-chip index delay circuit.
- AGC circuit.
- Thermal protection circuit.

Index and Timing Chart

When SL1=high level

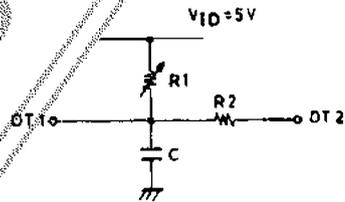

$$T_{300} \approx 0.693CR1$$

$$t_{300} \approx \frac{CR1R2}{R1+R2} \left\{ 0.405 + 1n \left( \frac{R1-R2}{R1-2R2} \right) \right\}$$

When SL1=low level.

$$T_{360} \approx 0.577CR1$$

$$t_{360} \approx \frac{CR1R2}{R1+R2} \left\{ 0.522 + 1n \left( \frac{0.781R1-R2}{R1-2R2} \right) \right\}$$

Using only the ID pulse involves shorting DT1 and DT2.
