

QUAD VOLTAGE COMPARATOR

LM139A/239A/339A/LM139/239/339/
LM2901/MC3302

DESCRIPTION

The LM139 series consists of four independent precision voltage comparators with an offset voltage specification as low as 2.0mV max for each comparator which were designed specifically to operate from a single power supply over a wide range of voltages. Operation from split power supplies is also possible and the low power supply current drain is independent of the magnitude of the power supply voltage. These comparators also have a unique characteristic in that the input common mode voltage range includes ground, even though operated from a single power supply voltage.

The LM139 series was designed to directly interface with TTL and CMOS. When operated from both plus and minus power supplies, the LM139 series will directly interface with MOS logic where their low power drain is a distinct advantage over standard comparators.

FEATURES

- Wide single supply voltage range 2.0Vdc to 36Vdc or dual supplies ± 1.0 Vdc to ± 18 Vdc
- Very low supply current drain (0.8mA) independent of supply voltage (1.0mW/comparator at 5.0Vdc)
- Low input biasing current 25nA
- Low input offset current ± 5 nA and offset voltage
- Input common-mode voltage range includes ground
- Differential input voltage range equal to the power supply voltage.
- Low output 250mV at 4mA saturation voltage
- Output voltage compatible with TTL, DTL, ECL, MOS and CMOS logic systems.

APPLICATIONS

- A/D converters
- Wide range VCO
- MOS clock generator
- High voltage logic gate
- Multivibrators

PIN CONFIGURATION

ABSOLUTE MAXIMUM RATINGS

PARAMETER	RATING	UNIT
Vcc supply voltage	36 or ± 18	
Differential input voltage	36	
Input voltage	-0.3 to +36	
Power dissipation ¹		
N package	570	mW
F package	900	mW
Output short circuit to ground ²	Continuous	
Input current ($V_{IN} < -0.3$ Vdc) ³	50	mA
Operating temperature range		
LM139/A	-55 to +125	°C
LM239/A	-25 to +85	°C
LM339/A	0 to +70	°C
LM2901/MC3302	-40 to +85	°C
Storage temperature range	-65 to +150	°C
Lead temperature (soldering 10 sec.)	300	°C

EQUIVALENT CIRCUIT

QUAD VOLTAGE COMPARATOR

LM139A/239A/339A/LM139/239/339/
LM2901/MC3302

DC ELECTRICAL CHARACTERISTICS $V+ = 5Vdc$, LM139A/LM139: $-55^{\circ}C \leq T_A \leq 125^{\circ}C$ unless otherwise specified
LM239: $-25^{\circ}C \leq T_A \leq 85^{\circ}C$ unless otherwise specified
LM339: $0^{\circ}C \leq T_A \leq 70^{\circ}C$ unless otherwise specified
 $V+ = 5Vdc$, LM339A: $0^{\circ}C \leq T_A \leq 70^{\circ}C$ unless otherwise specified
LM239A: $-25^{\circ}C \leq T_A \leq 85^{\circ}C$ unless otherwise specified
LM2901/LM3302: $-40^{\circ}C \leq T_A \leq 85^{\circ}C$ unless otherwise specified

QUAD VOLTAGE COMPARATOR

LM139A/239A/339A/LM139/239/339/
LM2901/MC3302

NOTES

- For operating at high temperatures, the LM339/339A, LM2901 and MC3302 must be derated based on a 125°C maximum junction temperature and a thermal resistance of 175°C/W which applies for the device soldered in a printed circuit board, operating in a still air ambient. The LM139/139A/239/239A must be derated on a 150°C maximum junction temperature. The low power dissipation and the "On-Off" characteristics of the outputs keep the chip dissipation very small ($P_D \leq 100\text{mW}$), provided the output transistors are allowed to saturate.
- Short circuits from the output to V_+ can cause excessive heating and eventual destruction. The maximum output current is approximately 20mA independent of the magnitude of V_+ .
- This input current will only exist when the voltage at any of the input leads is driven negative. It is due to the collector-base junction of the input PNP transistors becoming forward biased and thereby acting as input diode clamps. In addition to this diode action, there is also lateral NPN parasitic transistor action on the IC chip. This transistor action can cause the output voltages of the comparators to go to the V_+ voltage level (or to ground for a large overdrive) for the time duration that an input is driven negative. This is not destructive and normal output states will re-establish when the input voltage, which was negative, again returns to a value greater than -0.3Vdc .
- Positive excursions of input voltage may exceed the power supply level by 17 volts. As long as the other voltage remains within the common-mode range, the comparator will provide a proper output state. The low input voltage state must not be less than -0.3Vdc (or 0.3Vdc below the magnitude of the negative power supply, if used).
- At output switch point, $V_O \approx 1.4\text{Vdc}$, $R_S = 0\Omega$ with V_+ from 5Vdc to 30Vdc ; and over the full input common-mode range (0Vdc to $V_+ - 1.5\text{Vdc}$).
- The input common-mode voltage or either input signal voltage should not be allowed to go negative by more than 0.3V . The upper end of the common-mode voltage range is $V_+ - 1.5\text{V}$, but either or both inputs can go to 30Vdc without damage.
- The direction of the input current is out of the IC due to the PNP input stage. This current is essentially constant, independent of the state of the output so no loading change exists on the reference or input lines.
- The response time specified is for a 100mV input step with a 5mV overdrive. For larger overdrive signals, 300ns can be obtained, see typical performance characteristics section.

QUAD VOLTAGE COMPARATOR

LM139A/239A/339A/LM139/239/339/
LM2901/MC3302

TYPICAL APPLICATIONS

TWO-DECADE HIGH-FREQUENCY VCO

LIMIT COMPARATOR

VISIBLE VOLTAGE INDICATOR

TTL TO MOS LOGIC CONVERTER

CRYSTAL CONTROLLED OSCILLATOR

NOTE:
 Inputs of unused comparators should be grounded.
