

# LM6121/LM6221/LM6321 High Speed Buffer

## General Description

These high speed unity gain buffers slew at 800 V/ $\mu$ s and have a small signal bandwidth of 50 MHz while driving a 50 $\Omega$  load. They can drive  $\pm 300$  mA peak and do not oscillate while driving large capacitive loads. The LM6121 family are monolithic ICs which offer performance similar to the LH0002 with the additional features of current limit and thermal shutdown.

These buffers are built with National's VIPTM (Vertically Integrated PNP) process which provides fast PNP transistors that are true complements to the already fast NPN devices. This advanced junction-isolated process delivers high speed performance without the need for complex and expensive dielectric isolation.

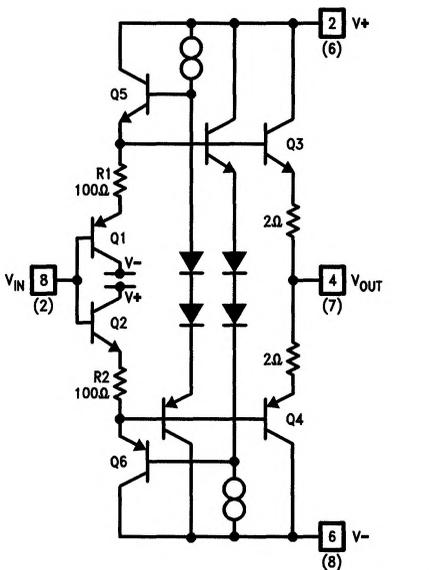

## Features

- High slew rate 800 V/ $\mu$ s
- Wide bandwidth 50 MHz
- Slew rate and bandwidth 100% tested
- Peak output current  $\pm 300$  mA
- High input impedance 5 M $\Omega$
- LH0002H pin compatible
- No oscillations with capacitive loads
- 5V to  $\pm 15$ V operation guaranteed
- Current and thermal limiting
- Fully specified to drive 50 $\Omega$  lines

## Applications

- Line Driving
- Radar
- Sonar

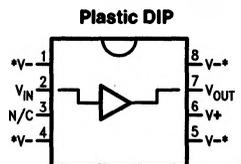

## Simplified Schematic

Numbers in ( ) are for 8-pin N DIP.

**Absolute Maximum Ratings** (Note 1)

If Military/Aerospace specified devices are required, please contact the National Semiconductor Sales Office/Distributors for availability and specifications.

Supply Voltage	36V ( $\pm 18$ )
Input to Output Voltage (Note 2)	$\pm 7V$
Input Voltage	$\pm V_{supply}$
Output Short-Circuit to GND (Note 3)	Continuous
Storage Temperature Range	$-65^{\circ}C$ to $+150^{\circ}C$
Lead Temperature (Soldering, 10 seconds)	$260^{\circ}C$
Power Dissipation (Note 10)	

ESD Tolerance (Note 8)	$\pm 2000V$
Junction Temperature ( $T_{J(max)}$ )	$150^{\circ}C$

**Operating Ratings**

Operating Temperature Range	
LM6121H/883	$-55^{\circ}C$ to $+125^{\circ}C$
LM6221	$-40^{\circ}C$ to $+85^{\circ}C$
LM6321	$0^{\circ}C$ to $+70^{\circ}C$
Operating Supply Range	$4.75$ to $\pm 16V$
Thermal Resistance ( $\theta_{JA}$ ), (Note 4)	
H Package	$150^{\circ}C/W$
N Package	$47^{\circ}C/W$
M Package	$69^{\circ}C/W$
Thermal Resistance ( $\theta_{JC}$ ), H Package	$17^{\circ}C/W$

**DC Electrical Characteristics**

The following specifications apply for Supply Voltage =  $\pm 15V$ ,  $V_{CM} = 0$ ,  $R_L \geq 100 k\Omega$  and  $R_S = 50\Omega$  unless otherwise noted. **Boldface** limits apply for  $T_A = T_J = T_{MIN}$  to  $T_{MAX}$ ; all other limits  $T_A = T_J = 25^{\circ}C$ .

**Note 1:** Absolute Maximum Ratings indicate limits beyond which damage to the device may occur. DC and AC electrical specifications do not apply when operating the device beyond its rated operating conditions.

**Note 2:** During current limit or thermal limit, the input current will increase if the input to output differential voltage exceeds 8V. For input to output differential voltages in excess of 8V the input current should be limited to  $\pm 20\text{ mA}$ .

**Note 3:** The LM6121 series buffers contain current limit and thermal shutdown to protect against fault conditions.

**Note 4:** The thermal resistance  $\theta_{JA}$  of the device in the N package is measured when soldered directly to a printed circuit board, and the heat-sinking pins (pins 1, 4, 5 and 8) are connected to 2 square inches of 2 oz. copper. When installed in a socket, the thermal resistance  $\theta_{JA}$  of the N package is  $84^\circ\text{C}/\text{W}$ . The thermal resistance  $\theta_{JA}$  of the device in the M package is measured when soldered directly to a printed circuit board, and the heat-sinking pins (pins 1, 2, 6, 7, 8, 9, 13, 14) are connected to 1 square inch of 2 oz. copper.

**Note 5:** Limits are guaranteed by testing or correlation.

**Note 6:** The input is biased to 2.5V and  $V_{IN}$  swings  $V_{PP}$  about this value. The input swing is  $2 V_{PP}$  at all temperatures except for the A<sub>V3</sub> test at  $-55^\circ\text{C}$  where it is reduced to  $1.5 V_{PP}$ .

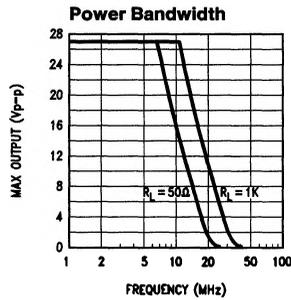

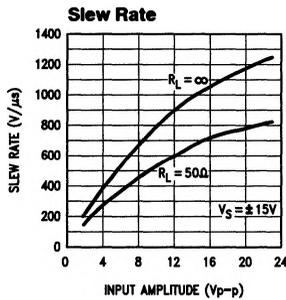

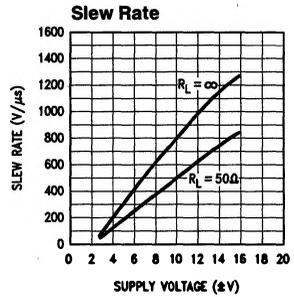

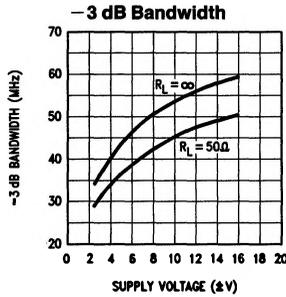

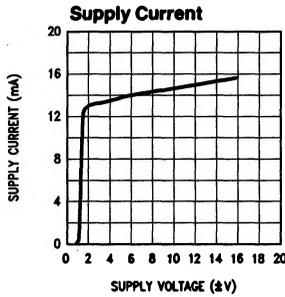

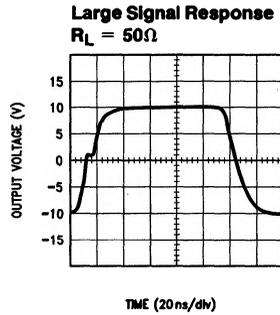

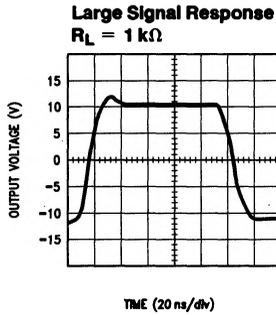

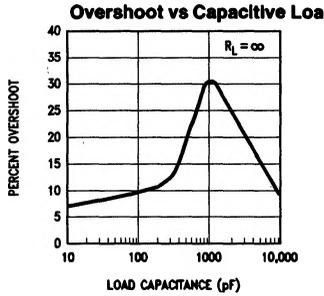

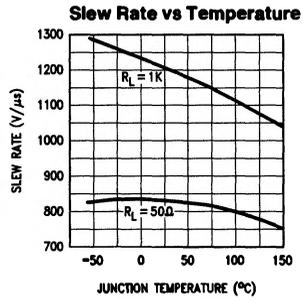

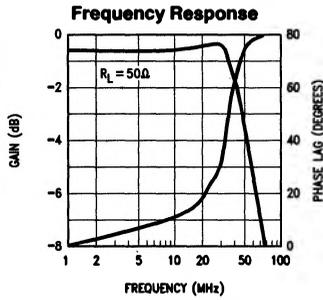

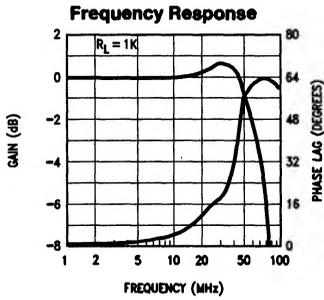

**Note 7:** Slew rate is measured with a  $\pm 11V$  input pulse and  $50\Omega$  source impedance at  $25^\circ\text{C}$ . Since voltage gain is typically 0.9 driving a  $50\Omega$  load, the output swing will be approximately  $\pm 10V$ . Slew rate is calculated for transitions between  $\pm 5V$  levels on both rising and falling edges. A high speed measurement is done to minimize device heating. For slew rate versus junction temperature see typical performance curves. The input pulse amplitude should be reduced to  $\pm 10V$  for measurements at temperature extremes. For accurate measurements, the input slew rate should be at least  $1700\text{ V}/\mu\text{s}$ .

**Note 8:** The test circuit consists of the human body model of  $120\text{ pF}$  in series with  $1500\Omega$ .

**Note 9:** For specification limits over the full Military Temperature Range, see RETS6121X.

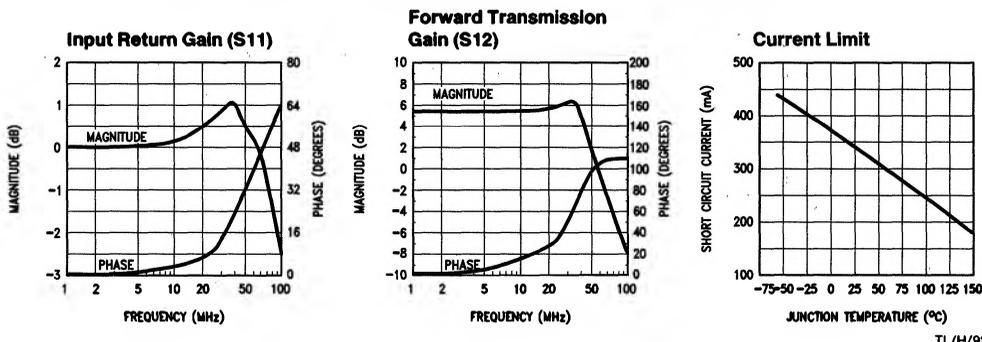

**Note 10:** The maximum power dissipation is a function of  $T_{J(max)}$ ,  $\theta_{JA}$ , and  $T_A$ . The maximum allowable power dissipation at any ambient temperature is  $P_D = (T_{J(max)} - T_A) / \theta_{JA}$ .

**Typical Performance Characteristics**  $T_J = 25^\circ\text{C}$ , unless otherwise specified

TL/H/9223-4

## Typical Performance Characteristics $T_J = 25^\circ\text{C}$ , unless otherwise specified (Continued)

TL/H/9223-5

## Application Hints

### POWER SUPPLY DECOUPLING

The method of supply bypassing is not critical for stability of the LM6121 series buffers. However, their high current output combined with high slew rate can result in significant voltage transients on the power supply lines if much inductance is present. For example, a slew rate of  $900\text{ V}/\mu\text{s}$  into a  $50\ \Omega$  load produces a  $di/dt$  of  $18\text{ A}/\mu\text{s}$ . Multiplying this by a wiring inductance of  $50\text{ nH}$  (which corresponds to approximately  $1\frac{1}{2}$ " of 22 gauge wire) result in a  $0.9\text{V}$  transient. To minimize this problem use high quality decoupling very close to the device. Suggested values are a  $0.1\ \mu\text{F}$  ceramic in parallel with one or two  $2.2\ \mu\text{F}$  tantalums. A ground plane is recommended.

### LOAD IMPEDANCE

The LM6121 is stable to any load when driven by a  $50\ \Omega$  source. As shown in the *Overshoot vs Capacitive Load* graph, worst case is a purely capacitive load of about  $1000\text{ pF}$ . Shunting the load capacitance with a resistor will reduce overshoot.

### SOURCE INDUCTANCE

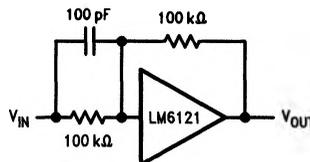

Like any high frequency buffer, the LM6121 can oscillate at high values of source inductance. The worst case condition occurs at a purely capacitive load of  $50\text{ pF}$  where up to  $100\text{ nH}$  of source inductance can be tolerated. With a  $50\ \Omega$  load, this goes up to  $200\text{ nH}$ . This sensitivity may be reduced at the expense of a slight reduction in bandwidth by adding a resistor in series with the buffer input. A  $100\ \Omega$  resistor will ensure stability with source inductances up to  $400\text{ nH}$  with any load.

### OVERVOLTAGE PROTECTION

The LM6121 may be severely damaged or destroyed if the Absolute Maximum Rating of  $7\text{V}$  between input and output pins is exceeded.

If the buffer's input-to-output differential voltage is allowed to exceed  $7\text{V}$ , a base-emitter junction will be in reverse-breakdown, and will be in series with a forward-biased base-emitter junction. Referring to the LM6121 simplified schematic, the transistors involved are Q1 and Q3 for positive inputs, and Q2 and Q4 for negative inputs. If any current is allowed to flow through these junctions, localized heating of the reverse-biased junction will occur, potentially causing damage. The effect of the damage is typically increased offset voltage, increased bias current, and/or degraded AC performance. Furthermore, this will defeat the short-circuit and over-temperature protection circuitry. Exceeding  $\pm 7\text{V}$  input with a shorted output will destroy the device.

The device is best protected by the insertion of the parallel combination of a  $100\text{ k}\Omega$  resistor (R1) and a small capacitor (C1) in series with the buffer input, and a  $100\text{ k}\Omega$  resistor (R2) from input to output of the buffer (see Figure 1). This network normally has no effect on the buffer output. However, if the buffer's current limit or shutdown is activated, and the output has a ground-referred load of significantly less than  $100\text{ k}\Omega$ , a large input-to-output voltage may be present. R1 and R2 then form a voltage divider, keeping the input-output differential below the  $7\text{V}$  Maximum Rating for input voltages up to  $14\text{V}$ . This protection network should be sufficient to protect the LM6121 from the output of nearly any op amp which is operated on supply voltages of  $\pm 15\text{V}$  or lower.

## Application Hints

### HEATSINK REQUIREMENTS

A heatsink may be required with the LM6321 depending on the maximum power dissipation and maximum ambient temperature of the application. Under all possible operating conditions, the junction temperature must be within the range specified under Absolute Maximum Ratings.

To determine if a heatsink is required, the maximum power dissipated by the buffer,  $P(\max)$ , must be calculated. The formula for calculating the maximum allowable power dissipation in any application is  $P_D = (T_J(\max) - T_A) / \theta_{JA}$ . For the simple case of a buffer driving a resistive load as in Figure 2, the maximum DC power dissipation occurs when the output is at half the supply. Assuming equal supplies, the formula is  $P_D = I_S(2V^+) + V^+{}^2/2R_L$ .

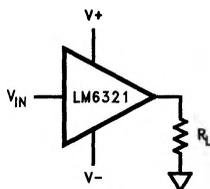

FIGURE 2

TL/H/9223-8

The next parameter which must be calculated is the maximum allowable temperature rise,  $T_R(\max)$ . This is calculated by using the formula:

$$T_R(\max) = T_J(\max) - T_A(\max)$$

where:  $T_J(\max)$  is the maximum allowable junction temperature

$T_A(\max)$  is the maximum ambient temperature

Using the calculated values for  $T_R(\max)$  and  $P(\max)$ , the required value for junction-to-ambient thermal resistance,  $\theta_{(J-A)}$ , can now be found:

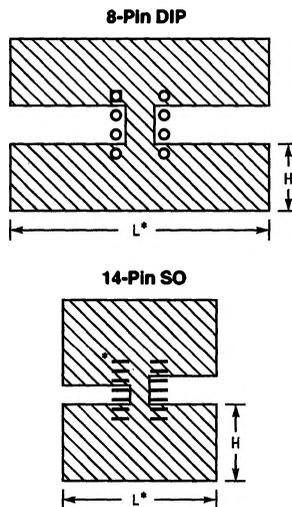

$$\theta_{(J-A)} = T_R(\max) / P(\max)$$

The heatsink for the LM6321 is made using the PC board copper. The heat is conducted from the die, through the lead frame (inside the part), and out the pins which are soldered to the PC board. The pins used for heat conduction are:

TABLE I

Part	Package	Pins
LM6321N	8-Pin DIP	1, 4, 5, 8
LM6321M	14-Pin SO	1, 2, 3, 6, 7, 8, 9, 13, 14

Figure 3 shows copper patterns which may be used to dissipate heat from the LM6321.

TL/H/9223-9

TL/H/9223-10

\*For best results, use  $L = 2H$

FIGURE 3. Copper Heatsink Patterns

Table II shows some values of junction-to-ambient thermal resistance ( $\theta_{J-A}$ ) for values of L and W for 2 oz. copper:

TABLE II

Package	L (in.)	H (in.)	$\theta_{J-A}$ (°C/W)
8-Pin DIP	2	0.5	47
14-Pin SO	1	0.5	69
	2	1	57
