CMOS PROGRAMMABLE PERIPHERAL INTERFACE

GENERAL DESCRIPTION

The MSM82C55A is a programmable universal I/O interface device which operates as high speed and on low power consumption due to 3μ silicon gate CMOS technology. It is the best fit as an I/O port in a system which employs the 8-bit parallel processing MSM80C85A CPU. This device has 24-bit I/O pins equivalent to three 8-bit I/O ports and all inputs/outputs are TTL interface compatible.

FEATURES

- High speed and low power consumption due to 3μ silicon gate CMOS technology
- 3 V to 6 V single power supply
- Full static operation
- Programmable 24-bit I/O ports
- Bidirectional bus operation (Port A)
- Bit set/reset function (Port C)
- TTL compatible
- 40-pin DIP (MSM82C55A-5RS/MSM82C55A-2RS)
- 44-pin flat package (MSM82C55A-5GS/MSM82C55A-2GS)
- 44-pin PLCC (MSM82C55A-2JS)
- Compatible with 8255A-5

OUTPUT CHARACTERISTICS (REFERENCE VALUE)

1 Output "H" Voltage (V_{OH}) vs. Output Current (I_{OH})

2 Output "L" Voltage (V_{OL}) vs. Output Current (I_{OL})

Note: The direction of flowing into the device is taken as positive for the output current.

FUNCTIONAL DESCRIPTION OF PIN

Pin No.	Item	Input/Output	Function
D7 ~ D0	Bidirectional data bus	Input and output	These are three-state 8-bit bidirectional buses used to write and read data upon receipt of the $\overline{WR}$ and $\overline{RD}$ signals from CPU and also used when control words and bit set/reset data are transferred from CPU to MSM82C55A.
RESET	Reset input	Input	This signal is used to reset the control register and all internal registers when it is in high level. At this time, ports are all made into the input mode (high impedance status).
$\overline{CS}$	Chip select input	Input	When the $\overline{CS}$ is in low level, data transmission is enabled with CPU. When it is in high level, the data bus is made into the high impedance status where no write nor read operation is performed. Internal registers hold their previous status, however.
$\overline{RD}$	Read input	Input	When $\overline{RD}$ is in low level, data is transferred from MSM82C55A to CPU.
$\overline{WR}$	Write input	Input	When $\overline{WR}$ is in low level, data or control words are transferred from CPU to MSM82C55A.
A0, A1	Port select input (address)	Input	By combination of A0 and A1, either one is selected from among port A, port B, port C, and control register. These pins are usually connected to low order 2 bits of the address bus.
PA7 ~ PA0	Port A	Input and output	These are universal 8-bit I/O ports. The direction of inputs/outputs can be determined by writing a control word. Especially, port A can be used as a bidirectional port when it is set to mode 2.
PB7 ~ PB0	Port B	Input and output	These are universal 8-bit I/O ports. The direction of inputs/outputs can be determined by writing a control word.
PC7 ~ PC0	Port C	Input and output	These are universal 8-bit I/O ports. The direction of inputs/outputs can be determined by writing a control word as 2 ports with 4 bits each. When port A or port B is used in mode 1 or mode 2 (port A only), they become control pins. Especially when port C is used as an output port, each bit can be set/reset independently.
VCC			+5 V power supply.
GND			GND

BASIC FUNCTIONAL DESCRIPTION

Group A and Group B

When setting a mode to a port having 24 bits, set it by dividing it into two groups of 12 bits each.

Group A: Port A (8 bits) and high order 4 bits of port C (PC7 ~ PC4)

Group B: Port B (8 bits) and low order 4 bits of port C (PC3 ~ PC0)

Mode 0, 1, 2

There are 3 types of modes to be set by grouping as follows:

Mode 0: Basic input operation/output operation (Available for both groups A and B)

Mode 1: Strobe input operation/output operation (Available for both groups A and B)

Mode 2: Bidirectional bus operation (Available for group A only)

When used in mode 1 or mode 2, however, port C has bits to be defined as ports for control signal for operation ports (port A for group A and port B for group B) of their respective groups.

Port A, B, C

The internal structure of 3 ports is as follows:

Port A: One 8-bit data output latch/buffer and one 8-bit data input latch

Port B: One 8-bit data input/output latch/buffer and one 8-bit data input buffer

Port C: One 8-bit data output latch/buffer and one 8-bit data input buffer (no latch for input)

Single bit set/reset function for port C

When port C is defined as an output port, it is possible to set (to turn to high level) or reset (to turn to low level) any one of 8 bits individually without affecting other bits.

OPERATIONAL DESCRIPTION

Control Logic

Operations by addresses and control signals, e.g., read and write, etc. are as shown in the table below:

Operation	A1	A0	$\overline{CS}$	$\overline{WR}$	$\overline{RD}$	Operation
Input	0	0	0	1	0	Port A → Data Bus
	0	1	0	1	0	Port B → Data Bus
	1	0	0	1	0	Port C → Data Bus
Output	0	0	0	0	1	Data Bus → Port A
	0	1	0	0	1	Data Bus → Port B
	1	0	0	0	1	Data Bus → Port C
Control	1	1	0	0	1	Data Bus → Control Register
Others	1	1	0	1	0	Illegal Condition
	x	x	1	x	x	Data bus is in the high impedance status.

Setting of Control Word

The control register is composed of 7-bit latch circuit and 1-bit flag as shown below.

Precaution for mode selection

The output registers for ports A and C are cleared to ϕ each time data is written in the command register and the mode is changed, but the port B state is undefined.

Bit Set/Reset Function

When port C is defined as output port, it is possible to set (set output to 1) or reset (set output to 0) any one of 8 bits without affecting other bits as shown next page.

Interrupt Control Function

When the MSM82C55A is used in mode 1 or mode 2, the interrupt signal for the CPU is provided. The interrupt request signal is output from port C. When the internal flip-flop INTE is set beforehand at this time, the desired interrupt request signal is output. When it is reset beforehand, however, the interrupt request signal is not output. The set/reset of the internal flip-flop is made by the bit set/reset operation for port C virtually.

Bit set → INTE is set → Interrupt allowed

Bit reset → INTE is reset → Interrupt inhibited

Operational Description by Mode

1. Mode 0 (Basic input/output operation)

Mode 0 makes the MSM82C55A operate as a basic input port or output port. No control signals such as interrupt request, etc. are required in this mode. All 24 bits can be used as two 8-bit ports and two 4-bit ports. Sixteen combinations are then possible for inputs/outputs. The inputs are not latched, but the outputs are.

Type	Control Word								Group A		Group B	
	D ₇	D ₆	D ₅	D ₄	D ₃	D ₂	D ₁	D ₀	Port A	High Order 4 Bits of Port C	Port B	Low Order 4 Bits of Port C
1	1	0	0	0	0	0	0	0	Output	Output	Output	Output
2	1	0	0	0	0	0	0	1	Output	Output	Output	Input
3	1	0	0	0	0	0	1	0	Output	Output	Input	Output
4	1	0	0	0	0	0	1	1	Output	Output	Input	Input
5	1	0	0	0	1	0	0	0	Output	Input	Output	Output
6	1	0	0	0	1	0	0	1	Output	Input	Output	Input
7	1	0	0	0	1	0	1	0	Output	Input	Input	Output
8	1	0	0	0	1	0	1	1	Output	Input	Input	Input
9	1	0	0	1	0	0	0	0	Input	Output	Output	Output
10	1	0	0	1	0	0	0	1	Input	Output	Output	Input
11	1	0	0	1	0	0	1	0	Input	Output	Input	Output
12	1	0	0	1	0	0	1	1	Input	Output	Input	Input
13	1	0	0	1	1	0	0	0	Input	Input	Output	Output
14	1	0	0	1	1	0	0	1	Input	Input	Output	Input
15	1	0	0	1	1	0	1	0	Input	Input	Input	Output
16	1	0	0	1	1	0	1	1	Input	Input	Input	Input

Note: When used in mode 0 for both groups A and B

2. Mode 1 (Strobe input/output operation)

In mode 1, the strobe, interrupt and other control signals are used when input/output operations are made from a specified port. This mode is available for both groups A and B. In group A at this time, port A is used as the data line and port C as the control signal.

Following is a description of the input operation in mode 1.

STB (Strobe input)

- When this signal is low level, the data output from terminal to port is fetched into the internal latch of the port. This can be made independent from the CPU, and the data is not output to the data bus until the RD signal arrives from the CPU.

IBF (Input buffer full flag output)

- This is the response signal for the STB. This signal when turned to high level indicates that data is fetched into the input latch. This signal turns to high level at the falling edge of STB and to low level at the rising edge of RD.

INTR (Interrupt request output)

- This is the interrupt request signal for the CPU of the data fetched into the input latch. It is indicated by high level only when the internal INTE flip-flop is set. This signal turns to high level at the rising edge of the STB (IBF = 1 at this time)

and low level at the falling edge of the RD when the INTE is set.

INTE_A of group A is set when the bit for PC₄ is set, while INTE_B of group B is set when the bit for PC₂ is set.

Following is a description of the output operation of mode 1.

OBF (Output buffer full flag output)

- This signal when turned to low level indicates that data is written to the specified port upon receipt of the WR signal from the CPU. This signal turns to low level at the rising edge of the WR and high level at the falling edge of the ACK.

ACK (Acknowledge input)

- This signal when turned to low level indicates that the terminal has received data.

INTR (Interrupt request output)

- This is the signal used to interrupt the CPU when a terminal receives data from the CPU via the MSM82C55A-5. It indicates the occurrence of the interrupt in high level only when the internal INTE flip-flop is set. This signal turns to high level at the rising edge of the ACK (OBF = 1 at this time) and low level at the falling edge of WR when the INTE_B is set.

INTE_A of group A is set when the bit for PC₆ is set, while INTE_B of group B is set when the bit for PC₂ is set.

Mode 1 Input

Mode 1 output

Port C Function Allocation in Mode 1

Combination of Input/Output Port C	Group A: Input Group B: Input	Group A: Input Group B: Output	Group A: Output Group B: Input	Group A: Output Group B: Output
PC ₀	INTR _B	INTR _B	INTR _B	INTR _B
PC ₁	IBF _B	OB _F _B	IBF _B	OB _F _B
PC ₂	STB _B	ACK _B	STB _B	ACK _B
PC ₃	INTR _A	INTR _A	INTR _A	INTR _A
PC ₄	STB _A	STB _A	I/O	I/O
PC ₅	IBF _A	IBF _A	I/O	I/O
PC ₆	I/O	I/O	ACK _A	ACK _A
PC ₇	I/O	I/O	OB _F _A	OB _F _A

Note: I/O is a bit not used as the control signal, but it is available as a port of mode 0.

Examples of the relation between the control words and pins when used in mode 1 is shown below:

(a) When group A is mode 1 output and group B is mode 1 input.

(b) When group A is mode 1 input and group B is mode 1 output.

3. Mode 2 (Strobe bidirectional bus I/O operation)

In mode 2, it is possible to transfer data in 2 directions through a single 8-bit port. This operation is akin to a combination between input and output operations. Port C waits for the control signal in this case, too. Mode 2 is available only for group A, however.

Next, a description is made on mode 2.

OBF (Output buffer full flag output)

- This signal when turned to low level indicates that data has been written to the internal output latch upon receipt of the $\overline{WR}$ signal from the CPU. At this time, port A is still in the high impedance status and the data is not yet output to the outside. This signal turns to low level at the rising edge of the $\overline{WR}$ and high level at the falling edge of the $\overline{ACK}$.

ACK (Acknowledge input)

- When a low level signal is input to this pin, the high impedance status of port A is cleared, the buffer is enabled, and the data written to the internal output latch is output to port A. When the input returns to high level, port A is made into the high impedance status.

STB (Strobe input)

- When this signal turns to low level, the data output to the port from the pin is fetched into the internal input latch. The data is output to the data bus upon receipt of the $\overline{RD}$ signal from the CPU, but it remains in the high impedance status until then.

IBF (Input buffer full flag output)

- This signal when turned to high level indicates that data from the pin has been fetched into the input latch. This signal turns to high level at the falling edge of the $\overline{STB}$ and low level at the rising edge of the $\overline{RD}$.

INTR (Interrupt request output)

- This signal is used to interrupt the CPU and its operation in the same as in mode 1. There are two INTE flip-flops internally available for input and output to select either interrupt of input or output operation. The INTE1 is used to control the interrupt request for output operation and it can be reset by the bit set for PC₆. INTE2 is used to control the interrupt request for the input operation and it can be set by the bit set for PC₄.

Mode 2 I/O Operation

Port C Function Allocation in Mode 2

Port C	Function
PC ₀	Confirmed to the group B mode
PC ₁	
PC ₂	
PC ₃	INTRA
PC ₄	STBA
PC ₅	IBFA
PC ₆	ACKA
PC ₇	OBFA

Following is an example of the relation between the control word and the pin when used in mode 2.
When input in mode 2 for group A and in mode 1 for group B.

4. When Group A is Different in Mode from Group B
Group A and group B can be used by setting them in different modes each other at the same time. When either group is set to mode1 or mode 2, it is

possible to set the one not defined as a control pin in port C to both input and output as a port which operates in mode 0 at the 3rd and 0th bits of the control word.

(Mode combinations that define no control bit at port C)

	Group A	Group B	Port C							
			PC ₇	PC ₆	PC ₅	PC ₄	PC ₃	PC ₂	PC ₁	PC ₀
1	Mode 1 input	Mode 0	I/O	I/O	IBF _A	STB _A	INTR _A	I/O	I/O	I/O
2	Mode 0 output	Mode 0	OBFA	ACK _A	I/O	I/O	INTR _A	I/O	I/O	I/O
3	Mode 0	Mode 1 input	I/O	I/O	I/O	I/O	I/O	STB _B	IBF _B	INTR _B
4	Mode 0	Mode 1 output	I/O	I/O	I/O	I/O	I/O	ACK _B	OBFB	INTR _B
5	Mode 1 input	Mode 1 input	I/O	I/O	IBF _A	STB _A	INTR _A	STB _B	IBF _B	INTR _B
6	Mode 1 input	Mode 1 output	I/O	I/O	IBF _A	STB _A	INTR _A	ACK _B	OBFB	INTR _B
7	Mode 1 output	Mode 1 input	OBFA	ACK _A	I/O	I/O	INTR _A	STB _B	IBF _B	INTR _B
8	Mode 1 output	Mode 1 output	OBFA	ACK _A	I/O	I/O	INTR _A	ACK _B	OBFB	INTR _B
9	Mode 2	Mode 0	OBFA	ACK _A	IBF _A	STB _A	INTR _A	I/O	I/O	I/O

Controlled at the 3rd bit (D3)
of the control word

Controlled at the 0th bit (D0)
of the control word

When the I/O bit is set to input in this case, it is possible to access data by the normal port C read operation.

When set to output, PC₇ ~ PC₄ bits can be accessed by the bit set/reset function only. Meanwhile, 3 bits from PC₂ to PC₀ can be accessed by normal write operation.

The bit set/reset function can be used for all of PC₃ ~ PC₀ bits. Note that the status of port C varies according to the combination of modes like this.

5. Port C Status Read

When port C is used for the control signal, that is, in either mode 1 or mode 2, each control signal and

bus status signal can be read out by reading the content of port C.
The status read out is as follows:

	Group A	Group B	Status read on the data bus							
			D ₇	D ₆	D ₅	D ₄	D ₃	D ₂	D ₁	D ₀
1	Mode 1 input	Mode 0	I/O	I/O	IBF _A	INTE _A	INTR _A	I/O	I/O	I/O
2	Mode 1 output	Mode 0	$\overline{\text{OBF}}_A$	INTE _A	I/O	I/O	INTR _A	I/O	I/O	I/O
3	Mode 0	Mode 1 input	I/O	I/O	I/O	I/O	I/O	INTE _B	IBF _B	INTR _B
4	Mode 0	Mode 1 output	I/O	I/O	I/O	I/O	I/O	INTE _B	$\overline{\text{OBF}}_B$	INTR _B
5	Mode 1 input	Mode 1 input	I/O	I/O	IBF _A	INTE _A	INTR _A	INTE _B	IBF _B	INTR _B
6	Mode 1 input	Mode 1 output	I/O	I/O	IBF _A	INTE _A	INTR _A	INTE _B	$\overline{\text{OBF}}_B$	INTR _B
7	Mode 1 output	Mode 1 input	$\overline{\text{OBF}}_A$	INTE _A	I/O	I/O	INTR _A	INTE _B	IBF _B	INTR _B
8	Mode 1 output	Mode 1 output	$\overline{\text{OBF}}_A$	INTE _A	I/O	I/O	INTR _A	INTE _B	$\overline{\text{OBF}}_B$	INTR _B
9	Mode 2	Mode 0	$\overline{\text{OBF}}_A$	INTE ₁	IBF _A	INTE ₂	INTR _A	I/O	I/O	I/O
10	Mode 2	Mode 1 input	$\overline{\text{OBF}}_A$	INTE ₁	IBF _A	INTE ₂	INTR _A	INTE _B	IBF _B	INTR _B
11	Mode 2	Mode 1 output	$\overline{\text{OBF}}_A$	INTE ₁	IBF _A	INTE ₂	INTR _A	INTE _B	$\overline{\text{OBF}}_B$	INTR _B

6. Reset of MSM82C55A

Be sure to keep the RESET signal at power ON in the high level at least for 50 μ s. Subsequently, it

becomes the input mode at a high level pulse above 500 ns.

Note:

After a write command is executed to the command register, the internal latch is cleared in PORTA PORTC. For instance, 00H is output at the beginning of a write command when the output port is assigned. However, if PORTB is not cleared at this time, PORTB is unstable. In other words, PORTB only outputs ineffective data (unstable value according to the device) during the period from after a write command is executed till the first data is written to PORTB.
