- Independent Asynchronous Inputs and Outputs
- Low-Power Advanced CMOS Technology
- Bidirectional

1024 Words by 9 Bits Each

- Programmable Almost-Full/Almost-Empty Flag
- Empty, Full, and Half-Full Flags
- Access Times of 25 ns With a 50-pF Load
- Data Rates From 0 to 50 MHz
- Fall-Through Times of 23 ns Max
- High Output Drive for Direct Bus Interface
- 3-State Outputs
- Available in 44-Pin PLCC (FN) Package

## description

A FIFO memory is a storage device that allows data to be written into and read from its array at independent data rates. The SN74ACT2236 is arranged as two 1024 by 9-bit FIFOs for high speed and fast access times. It processes data at rates from 0 to 50 MHz with access times of 25 ns in a bit-parallel format.

The SN74ACT2236 consists of bus-transceiver circuits, two $1024 \times 9$ FIFOs, and control circuitry arranged for multiplexed transmission of data directly from the data bus or from the internal FIFO memories. Enable OE and DIR inputs are provided to control the transceiver functions. The select-control (SAB and SBA) inputs are provided to select whether real-time or stored data is transferred. The circuitry used for select control eliminates the typical decoding glitch that occurs in a multiplexer during the transition between stored and real-time data. Figure 1 shows the five fundamental bus-management functions that can be performed with the SN74ACT2236.

The SN74ACT2236 is characterized for operation from $0^{\circ} \mathrm{C}$ to $70^{\circ} \mathrm{C}$.
For more information on this device family, see the application report $1 \mathrm{~K} \times 9 \times 2$ Asynchronous FIFOs SN74ACT2235 and SN74ACT2236 in the 1996 High-Performance FIFO Memories Designer's Handbook, literature number SCAA012A.

Please be aware that an important notice concerning availability, standard warranty, and use in critical applications of Texas Instruments semiconductor products and disclaimers thereto appears at the end of this data sheet.

Terminal Functions

| TERMINAL |  | I/O | DESCRIPTION |
| :---: | :---: | :---: | :---: |
| NAME | No. |  |  |
| AF/AEA, AF/AEB | 15, 30 | 0 | Almost full/almost empty flags. The almost-full/almost-empty A flag (AF/AEA) is defined by the almost-full/almost-empty offset value for FIFO A (X). AF/AEA is high when FIFO A contains $X$ or less words or 1024 - X words. AF/AEA is low when FIFO A contains between X + 1 or 1023 - X words. The operation of the almost-full/almost-empty B flag (AF/AEB) is the same as AF/AEA for FIFO B. |
| A0-A8 | 4-8, 10-13 | I/O | A data inputs and outputs |
| B0-B8 | $\begin{aligned} & 32-35, \\ & 37-41 \end{aligned}$ | I/O | B data inputs and outputs |
| $\overline{\mathrm{DAF}}, \overline{\mathrm{DBF}}$ | 21, 24 | 1 | Define-flag inputs. The high-to-low transition of $\overline{\mathrm{DAF}}$ stores the binary value on $\mathrm{A} 0-\mathrm{A} 8$ as the almost-full/almost-empty offset value for FIFO A (X). The high-to-low transition of $\overline{\mathrm{DBF}}$ stores the binary value of B0-B8 as the almost-full/almost-empty offset value for FIFO B (Y). |
| $\begin{aligned} & \hline \overline{\text { EMPTYA, }} \\ & \hline \text { EMPTYB } \end{aligned}$ | 20, 25 | 0 | Empty flags. $\overline{\mathrm{EMPTYA}}$ and $\overline{\mathrm{EMPTYB}}$ are low when their corresponding memories are empty and high when they are not empty. |
| $\overline{\overline{\text { FULLA }}} \overline{\text { FULLB }}$ | 18, 27 | 0 | Full flags. FULLA and FULLB are low when their corresponding memories are full and high when they are not full. |
| HFA, HFB | 16, 29 | 0 | Half-full flags. HFA and HFB are high when their corresponding memories contain 512 or more words, and low when they contain 511 or less words. |
| LDCKA, LDCKB | 17, 28 | 1 | Load clocks. Data on A0-A8 is written into FIFO A on a low-to-high transition of LDCKA. Data on B0-B8 is written into FIFO B on a low-to-high transition of LDCKB. When the FIFOs are full, LDCKA and LDCKB have no effect on the data residing in memory. |
| DIR, $\overline{O E}$ | 2, 43 | 1 | Enable inputs. DIR and $\overline{\mathrm{OE}}$ control the transceiver functions. When OE is high, both AO-A8 and $\mathrm{BO}-\mathrm{B8}$ are in the high-impedance state and can be used as inputs. With $\overline{\mathrm{OE}}$ low and DIR high, the $A$ bus is in the high-impedance state and $B$ bus is active. When both $\overline{O E}$ and DIR are low, the $A$ bus is active and the $B$ bus is in the high-impedance state. |
| $\overline{\mathrm{RSTA}}, \overline{\mathrm{RSTB}}$ | 22, 23 | 1 | Reset. A reset is accomplished in each direction by taking $\overline{\text { RSTA }}$ and $\overline{\text { RSTB }}$ low. This sets $\overline{\text { EMPTYA }}$, $\overline{\text { EMPTYB }}$, $\overline{\text { FULLA }}$, $\overline{F U L L B}$, and AF/AEB high. Both FIFOs must be reset upon power up. |
| SAB, SBA | 1,44 | 1 | Select-control inputs. SAB and SBA select whether real-time or stored data is transferred. A low level selects real-time data, and a high level selects stored data. Eight fundamental bus-management functions can be performed as shown in Figure 1. |
| $\overline{\overline{\mathrm{UNCKA}}} \overline{\mathrm{UNCKB}}$ | 19, 26 | 1 | Unload clocks. Data in FIFO A is read to B0-B8 on a low-to-high transition of UNCKB. Data in FIFO B is read to A0-A8 on a low-to-high transition of UNCKB. When the FIFOs are empty, UNCKA and $\overline{\text { UNCKB }}$ have no effect on data residing in memory. |

## programming procedure for AF/AEA

The almost-full/almost-empty flags (AF/AEA, AF/AEB) are programmed during each reset cycle. The almost-full/almost-empty offset value FIFO A (X) and for FIFO B (Y) are either a user-defined value or the default values of $X=256$ and $Y=256$. Below are instructions to program AF/AEA using both methods. AF/AEB is programmed in the same manner for FIFO B.

## user-defined $X$

Take DAF from high to low. This stores A0 thru A8 as X.
If RSTA is not already low, take RSTA high.
With $\overline{\text { DAF }}$ held low, take $\overline{\text { RSTA }}$ high. This defines the AF/AEA flag using X.
To retain the current offset for the next reset, keep $\overline{\mathrm{DAF}}$ low.

## default $X$

To redefine the AF/AE flag using the default value of $X=256$, hold $\overline{\mathrm{DAF}}$ high during the reset cycle.
timing diagram for FIFO $\mathrm{A}^{\dagger}$

$\ddagger$ Operation of FIFO B is identical to that of FIFO A.
$\ddagger$ Last valid data stays on outputs when FIFO goes empty due to a read.

TYPICAL CHARACTERISTICS

## calculating power dissipation

The maximum power dissipation ( $\mathrm{P}_{\mathrm{T}}$ ) can be calculated by:

$$
\mathrm{P}_{\mathrm{T}}=\mathrm{V}_{\mathrm{CC}} \times\left[\mathrm{I}_{\mathrm{CC}}+\left(\mathrm{N} \times \Delta \mathrm{I}_{\mathrm{CC}} \times \mathrm{dc}\right)\right]+\Sigma\left(\mathrm{C}_{\mathrm{pd}} \times \mathrm{V}_{\mathrm{CC}}{ }^{2} \times \mathrm{f}_{\mathrm{i}}\right)+\Sigma\left(\mathrm{C}_{\mathrm{L}} \times \mathrm{V}_{\mathrm{CC}}{ }^{2} \times \mathrm{f}_{\mathrm{o}}\right)
$$

where:

$$
\begin{array}{ll}
\mathrm{I}_{\mathrm{CC}} & =\text { power-down I ICC maximum } \\
\mathrm{N} & =\text { number of inputs driven by a TTL device } \\
\Delta \mathrm{I}_{\mathrm{CC}} & =\text { increase in supply current } \\
\mathrm{dc} & =\text { duty cycle of inputs at a TTL high level of } 3.4 \mathrm{~V} \\
\mathrm{C}_{\mathrm{pd}} & =\text { power dissipation capacitance } \\
\mathrm{C}_{\mathrm{L}} & =\text { output capacitive load } \\
\mathrm{f}_{\mathrm{i}} & =\text { data input frequency } \\
\mathrm{f}_{\mathrm{O}} & =\text { data output frequency }
\end{array}
$$

${ }^{(1)}$ The marketing status values are defined as follows:
ACTIVE: Product device recommended for new designs.
LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.
NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.
PREVIEW: Device has been announced but is not in production. Samples may or may not be available.
OBSOLETE: TI has discontinued the production of the device.
${ }^{(2)}$ Eco Plan - The planned eco-friendly classification: Pb-Free (RoHS) or Green (RoHS \& no $\mathrm{Sb} / \mathrm{Br}$ ) - please check http://www.ti.com/productcontent for the latest availability information and additional product content details.
TBD: The $\mathrm{Pb}-\mathrm{Free} / \mathrm{Green}$ conversion plan has not been defined.
Pb -Free (RoHS): TI's terms "Lead-Free" or "Pb-Free" mean semiconductor products that are compatible with the current RoHS requirements for all 6 substances, including the requirement that lead not exceed $0.1 \%$ by weight in homogeneous materials. Where designed to be soldered at high temperatures, TI Pb-Free products are suitable for use in specified lead-free processes.
Green (RoHS \& no Sb/Br): TI defines "Green" to mean Pb-Free (RoHS compatible), and free of Bromine (Br) and Antimony (Sb) based flame retardants ( Br or Sb do not exceed $0.1 \%$ by weight in homogeneous material)
${ }^{(3)}$ MSL, Peak Temp. -- The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

Reproduction of this information with alteration is an unfair and deceptive business practice. TI is not responsible or liable for such altered documentation. Information of third parties may be subject to additional restrictions.

Resale of TI products or services with statements different from or beyond the parameters stated by TI for that product or service voids all express and any implied warranties for the associated Tl product or service and is an unfair and deceptive business practice. TI is not responsible or liable for any such statements.

TI products are not authorized for use in safety-critical applications (such as life support) where a failure of the TI product would reasonably be expected to cause severe personal injury or death, unless officers of the parties have executed an agreement specifically governing such use. Buyers represent that they have all necessary expertise in the safety and regulatory ramifications of their applications, and acknowledge and agree that they are solely responsible for all legal, regulatory and safety-related requirements concerning their products and any use of TI products in such safety-critical applications, notwithstanding any applications-related information or support that may be provided by TI. Further, Buyers must fully indemnify Tl and its representatives against any damages arising out of the use of Tl products in such safety-critical applications.
TI products are neither designed nor intended for use in military/aerospace applications or environments unless the TI products are specifically designated by TI as military-grade or "enhanced plastic." Only products designated by TI as military-grade meet military specifications. Buyers acknowledge and agree that any such use of TI products which TI has not designated as military-grade is solely at the Buyer's risk, and that they are solely responsible for compliance with all legal and regulatory requirements in connection with such use.
TI products are neither designed nor intended for use in automotive applications or environments unless the specific Tl products are designated by TI as compliant with ISO/TS 16949 requirements. Buyers acknowledge and agree that, if they use any non-designated products in automotive applications, TI will not be responsible for any failure to meet such requirements.
