

Features

- Narrow Band: 576 kbit/s Data Rate
- Supply-voltage Range 3 V to 4.6 V (Regulated)
- Auxiliary Voltage Regulator On-chip (3.2 V to 4.6 V)
- Low Current Consumption
- Few Low-cost External Components
- No Mechanical Tuning Required
- Supports Multiple Reference Clocks (10.368 MHz/13.824 MHz)
- Fast Settling Synthesizer (864 kHz Channel Spacing)
- TX Preamplifier with 3 dBm Output Power at 2.45 GHz (4 Programmable Power Levels)
- Ramp-signal Generator for Power Ramping and Power Control of External SiGe Power Amplifier (T7024 and T7026)

Description

The T2813 is an RF IC for low-power applications in the 2.45 GHz ISM band. The HP-VFQFP-N48-packaged IC is a complete transceiver including image rejection mixer, IF amplifier, FM demodulator, baseband filter, RSSI, TX preamplifier, power-ramping generator for power amplifiers, integrated synthesizer, fully integrated VCO and Gaussian data filter for TX. No mechanical tuning is necessary in production.

Functional Description

Receiver

The RF signal at RF_IN is fed to an image rejection mixer IR_MIXER with its differential outputs MIXER_OUT1 and MIXER_OUT2 driving an IF-SAW filter at 110.592 MHz or 112.32 MHz. The IF_AMP1 and IF_AMP2 IF amplifiers with an external IF_TANK and an integrated RSSI function feed the signal to the demodulator DEMOD working at $f = f_{IF}/2$ (≈ 55 MHz) and finally to an integrated baseband filter BB. For demodulator tuning in production an integrated 5-bit digital-to-analog (D/A) converter is provided to control the on-chip varicap diode.

Transmitter

The transmit data at TX_DATA is filtered by an integrated Gaussian Filter GF and fed to the fully integrated VCO operating at twice the output frequency. After modulation the signal is frequency-divided by 2 and fed via a TX/RX SWITCH to the TX_DRIVER. This bus-controlled driver amplifier supplies typically +3 dBm output power at TX_OUT. A ramp-signal generator RAMP_GEN, providing a ramp signal at RAMP_OUT for the external power amplifier, is integrated. The slope of the ramp signal is controlled by a capacitor at the RAMP_SET pin.

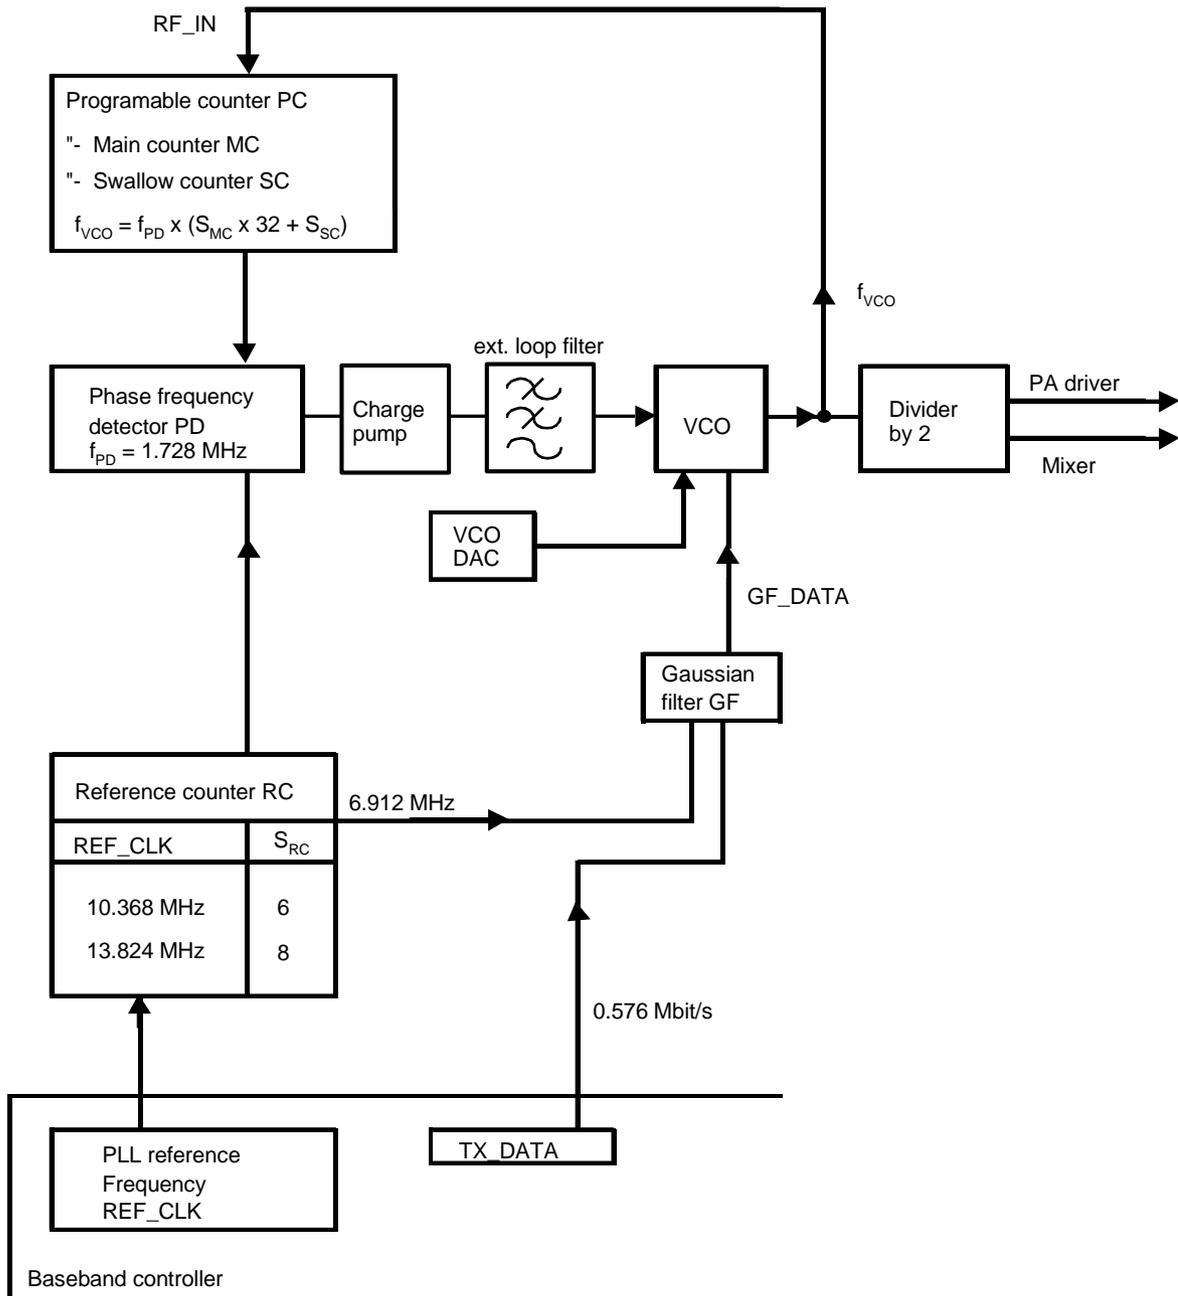

Synthesizer

The IR_MIXER, the TX_DRIVER and the programmable counter PC are driven by the fully integrated VCO (including on-chip inductors and varactors). The output signal is frequency-divided to supply the desired frequency to the TX_DRIVER, 0/90 degree phase shifter for the IR_MIXER and to be used by the PC for the phase detector PD ($f_{PD} = 1.728$ MHz). Open loop modulation is supported.

Power Supply

An integrated bandgap-stabilized voltage regulator for use with an external low-cost PNP transistor is implemented. Multiple power-down and current saving modes are provided.

Figure 3. PLL Principle

The following table shows the LO frequencies for RX and TX for the DECT band plus additional channels for the extended DECT band. Intermediate frequencies of 110.592 MHz and 112.32 MHz are supported.

Serial Programming Bus

The transceiver is programmed by the 3-wire bus (CLOCK, DATA and ENABLE).

After setting enable signal to low condition, on the rising edge of the clock signal, the data is transferred bit by bit into the shift register, starting with the MSB-bit. When the enable signal has returned to high condition, the programmed information is loaded into the addressed latches according to the address bit condition (last bit). Additional leading bits are ignored and there is no check made how many pulses arrived during enable low condition. During enable low condition, the bus current is increased to speed up the bus logic.

The programming of the transceiver is separated into two data words. Data word 1 controls mainly the channel information together with settings, which are closely related with the channel. Data word 2 holds setup information, which is adjusted during production.
