

COLOR TV SECAM DECODER FOR LOW-COST TV SETS

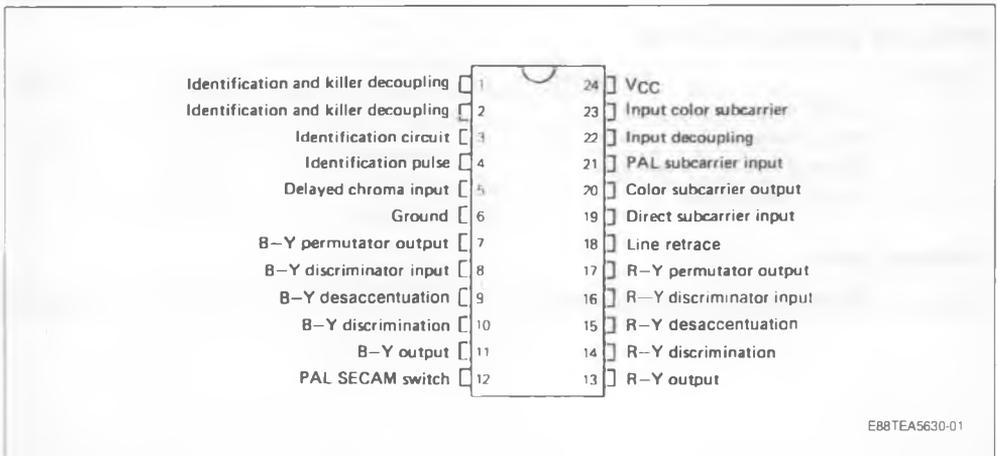

- SUBCARRIER LIMITER
- R-Y } DEMODULATORS
B-Y }
- IDENTIFICATION AND KILLER
- PAL-SECAM SWITCHES FOR MULTISTANDARD APPLICATION.

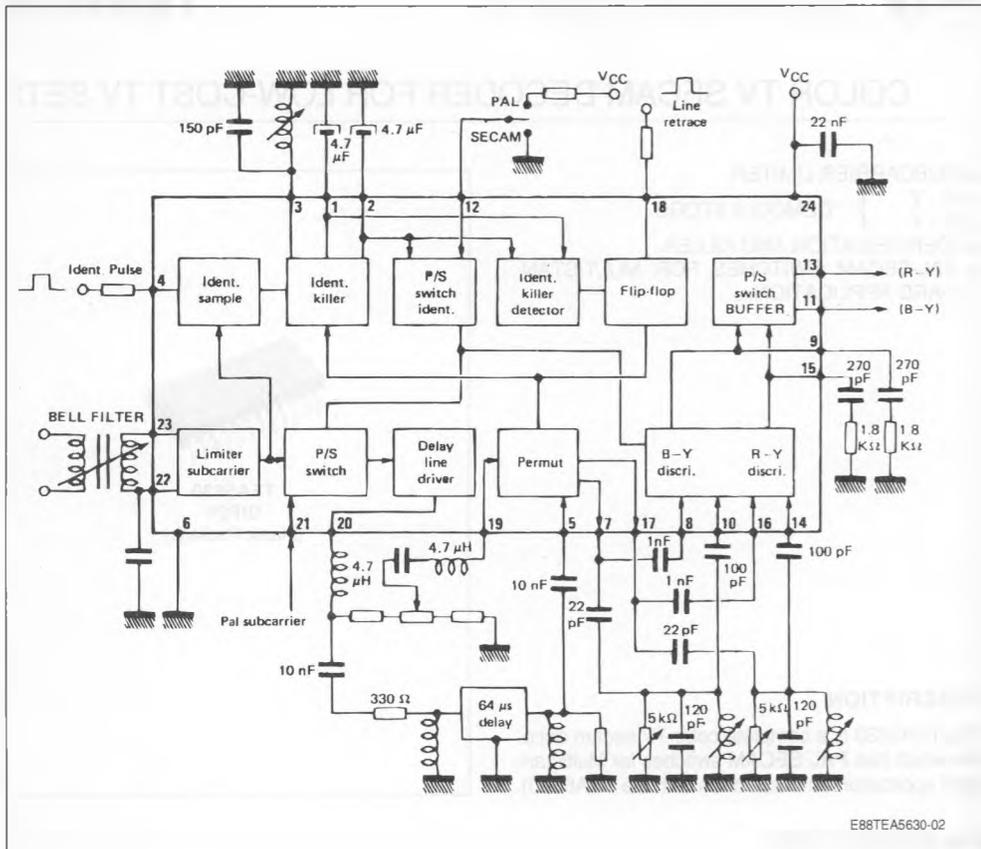

DESCRIPTION

The TEA5630 is a complete color TV secam decoder which has PAL-SECAM switches for Multistandard application (in association with the TEA5620).

GENERAL DESCRIPTION

LIMITER AND CHROMA PAL/SECAM SWITCHING

The chroma signal is applied to the input of a limiter stage. After limitation the output signal is sent to an electrical switch which selects the signal coming from the limiter (for SECAM) or from the PAL input (Pin 21). The high output voltage of chrominance signal, $2.2 V_{pp}$ in SECAM operation, permits to obtain a minimum of crosstalk in the permutation and discrimination. The DC output voltage of the PAL IC connected in parallel for PAL/SECAM must be higher than $V_{CC} - 5 V$.

LIMITER AND CHROMA PAL/SECAM SWITCH.

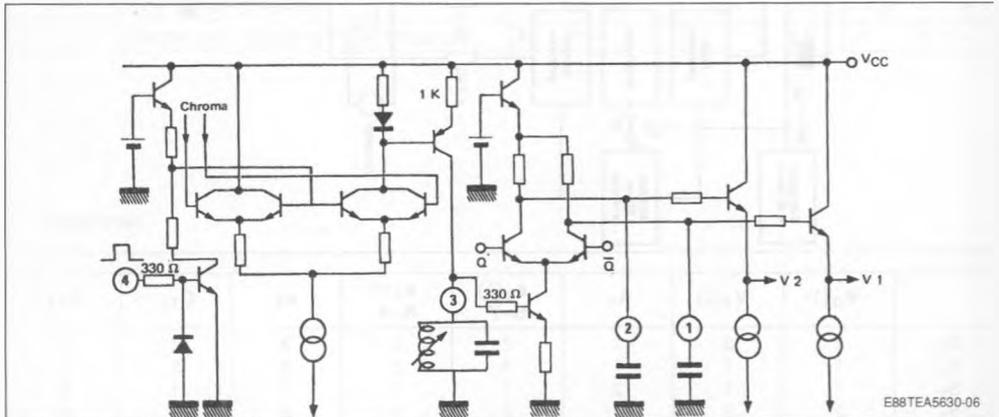

IDENTIFICATION AND KILLER

The identification information is sampled during the identification pulse (pin 4). The burst differential amplitude voltage on the according circuit pin 3 is amplified and held by capacitors pin 2 and pin 1 to give the right flip-flop phase and killer information.

The circuit is able to identify line by line or line and frame. The choice of identification mode is programmable by the user depending on the identification pulse pin 4.

IDENTIFICATION AND KILLER.

PERMUTATOR

Two inputs on the permutator :

- the direct signal is sent on pin 19,
- the delayed signal is sent on pin 5.

The permutator is controlled by a flip-flop at H/2 frequency in order to have (R - Y) signal on pin 17 and (B - Y) signal on pin 7. The output chroma signal typical value is 1.4 V.

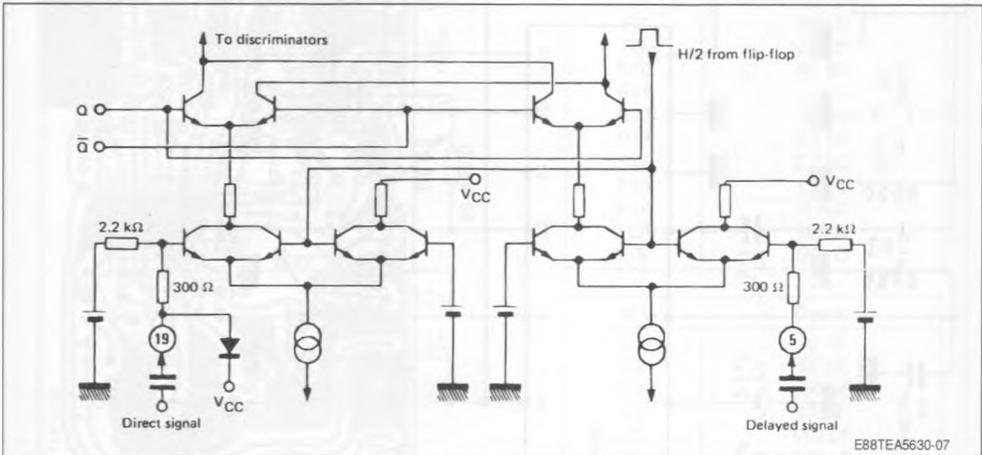

DISCRIMINATORS

They use coincidence detectors with external according circuit L-C. The (R - Y) and (B - Y) demodulated signal amplitude and linearity can be adjusted by the choice of the damping resistor value in parallel with the L-C circuit. The desaccentuation circuit is connected on the load of the coincidence detection.

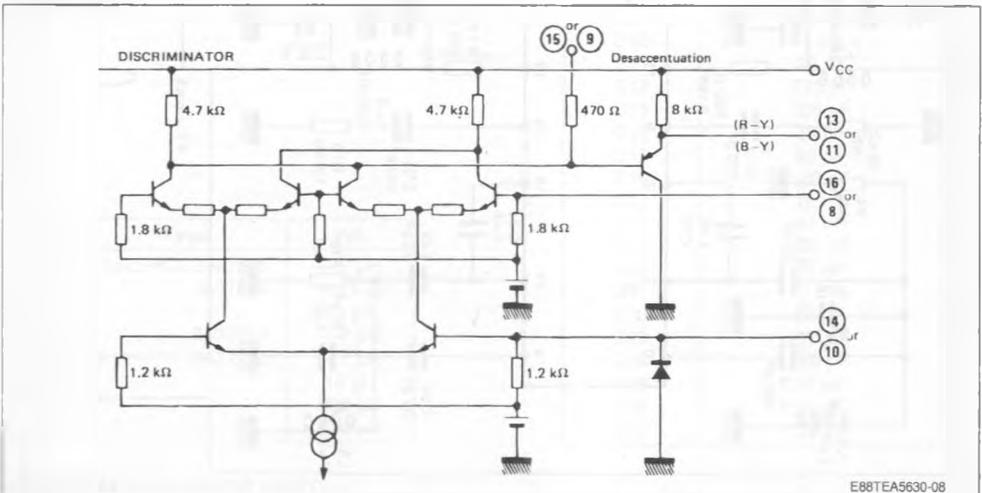

Two PNP emitter followers provide the (R - Y) and (B - Y) signals at low impedance output.

In PAL operating the output impedance is equivalent to a 8 K Ω resistance between output and V_{CC}.

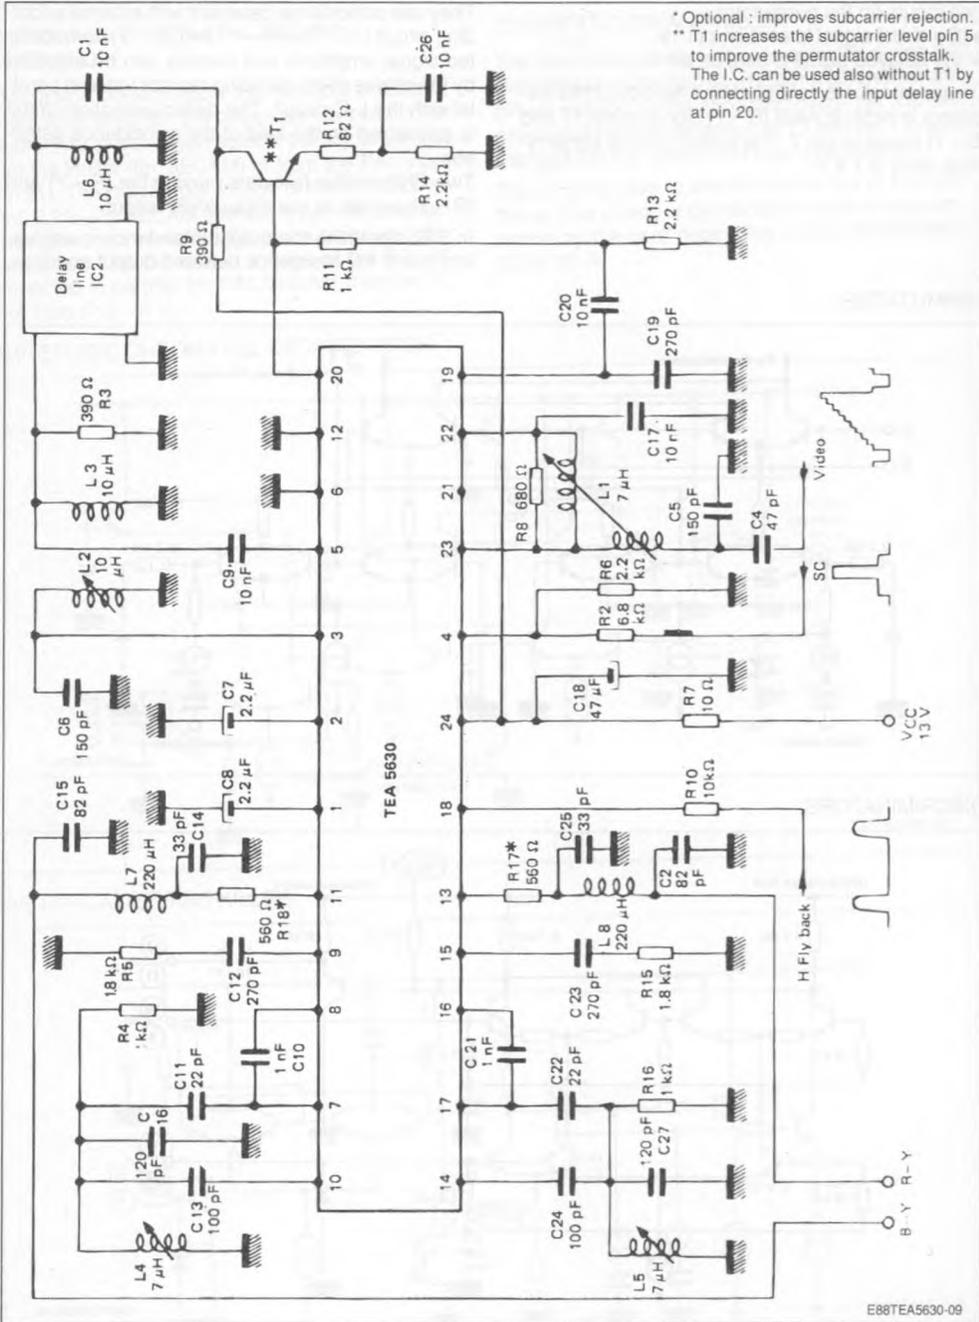

PERMUTATOR.

DISCRIMINATORS.

TYPICAL APPLICATION

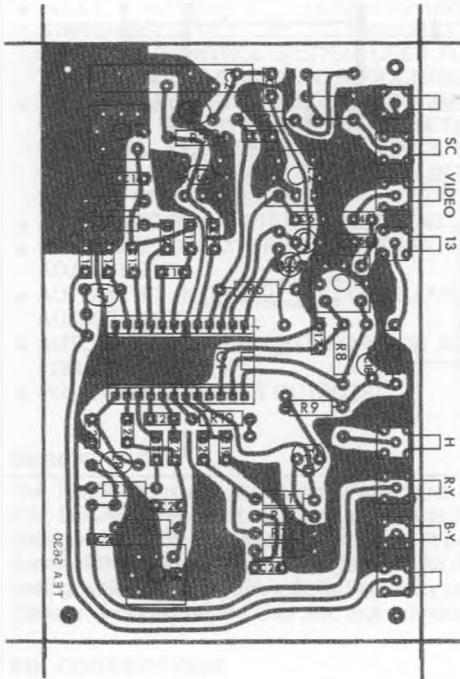

* Optional : improves subcarrier rejection.
 ** T1 increases the subcarrier level pin 5 to improve the permutator crosstalk. The I.C. can be used also without T1 by connecting directly the input delay line at pin 20.
