HALF-WAVE MERCURY-VAPOR RECTIFIER

GENERAL DATA

Electrical:

Filamentary Cathode, Coated:

Voltage $5 \pm 5\%$ ac volts

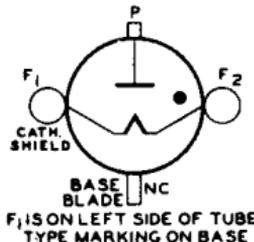

Current 19 amperes

Minimum Heating Time
at Rated Voltage . . . 60 seconds

Peak Tube Voltage
Drop (Approx.) . . . 15 volts

Mechanical:

Terminal Connections:

F₁ - Filament,
Cathode Shield
(Anode Return)

F₂ - Filament
Cap - Anode

Mounting Position Vertical with filament end down

Overall Length 14-1/4" $\pm 3/16$ "

Maximum Diameter 5-1/8"

Bulb GT-40

Cap Skirted Large { JETEC No. C1-9

RCA No. 3905

Base { JETEC No. A3-20

RCA No. 3502

Temperature Control:

Heating—When the ambient temperature is so low that the normal rise of condensed-mercury temperature above the ambient temperature will not bring the condensed-mercury temperature up to the minimum value of the operating ranges specified under *Maximum Ratings*, some form of heat-conserving enclosure or auxiliary heater will be required.

Cooling—When the operating conditions are such that the maximum value of the operating condensed-mercury temperature range is exceeded, provision should be made for forced-air cooling sufficient to prevent exceeding the maximum value.

CHARACTERISTICS RANGE VALUES FOR EQUIPMENT DESIGN

	Note	Min.	Max.	
Filament Current	1	-	21	amp
Critical Anode Voltage	2	-	100	volts
Peak Tube Voltage Drop	3	-	17	volts

Note 1: With 5 volts rms on filament.

Note 2: With 4.75 volts rms on filament, and condensed-mercury temperature at 30°C.

Note 3: With 5 volts rms on filament, condensed-mercury temperature of 35°±5°C, peak anode current of 50 amperes provided by half-cycle pulse from a 60-cps sine wave and recurring approximately once a second. Tube drop is measured by an oscilloscope connected between anode and center tap of filament transformer.

* With filament volts = 4.75 and no heat-conserving enclosure.

• Filament voltage in phase with anode voltage.

•• Filament voltage out of phase (60° to 120°) with anode voltage.

** Averaged over any period of 30 seconds maximum.

OPERATING NOTES

X-Ray Warning. X-rays are produced when the 869-B is operated with a peak inverse anode voltage above 16000 volts (absolute value). These rays can constitute a health hazard unless the tube is adequately shielded for x-ray radiation.
